**This course discusses methods of setting up a predictive maintenance program and the implementation and operation of the program.**

**Description:**

This course begins with the methods of setting up a predictive maintenance program and then covers the implementation and operation of the program. A detailed description of insulation resistance monitoring, oil analysis, vibration monitoring, acoustic leak monitoring, ultrasonic on-line bearing condition monitoring, thermography, replication, nondestructive evaluation, and fiber optics are covered in the course.

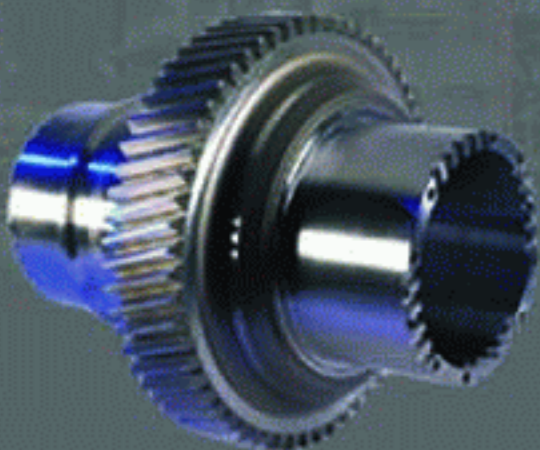

**Recommended for:**

This course is designed for engineers who are tasked with establishing or maintaining a predictive maintenance program.

**Benefits:**

Participants can use the skills and knowledge gained in this course to set up and implement a predictive maintenance program and identify potential failures in predictive maintenance programs before they cause excessive plant shutdowns. before they cause excessive plant shutdowns.
